

Agenda

- 1) Schema Design
 - ⇒ Inheritance
 - ⇒ Association

- 2) Models ⇒ coding

- 3) Controllers → user story

Schema Design

- 1) For every class ⇒ create a table in class dia
- 2) For all primitive attributes ⇒ Add a column in the table
- 3) For all non primitive ⇒ Find cardinality depending on cardinality represent it

DB

parking_lot			
id	name		address

parking_floors			
id	floor_no.	parking_lot_id	status

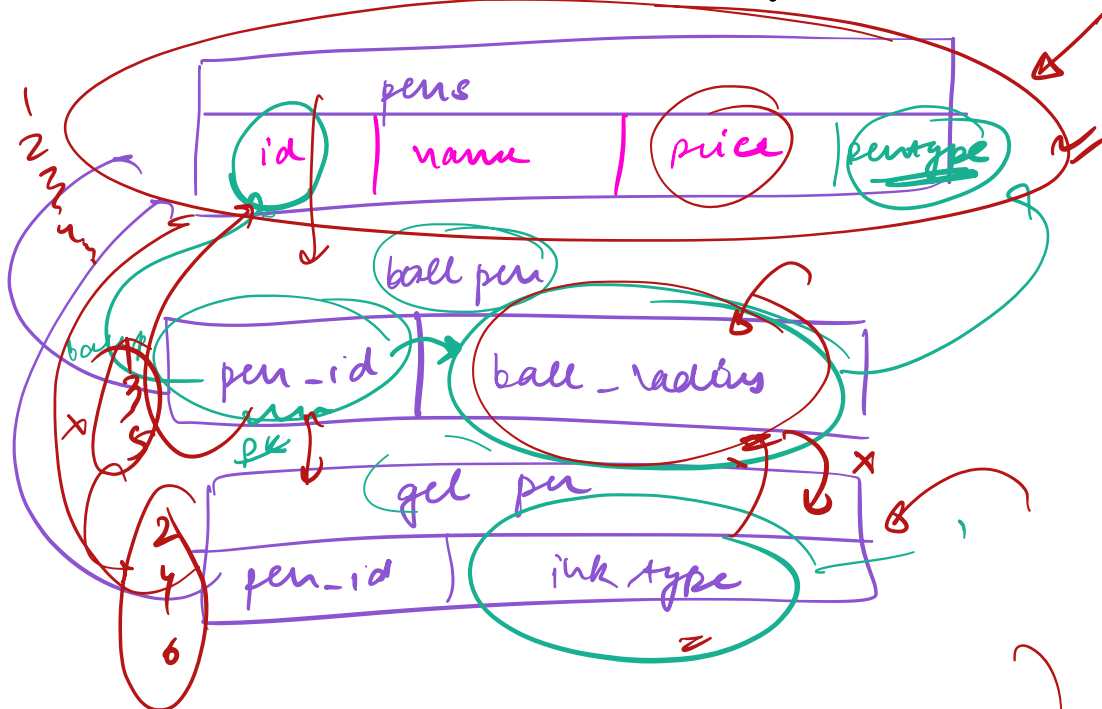

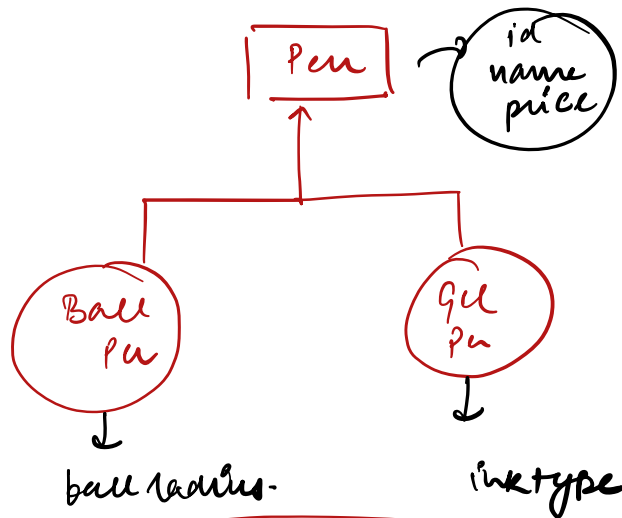

Parking Spot Status

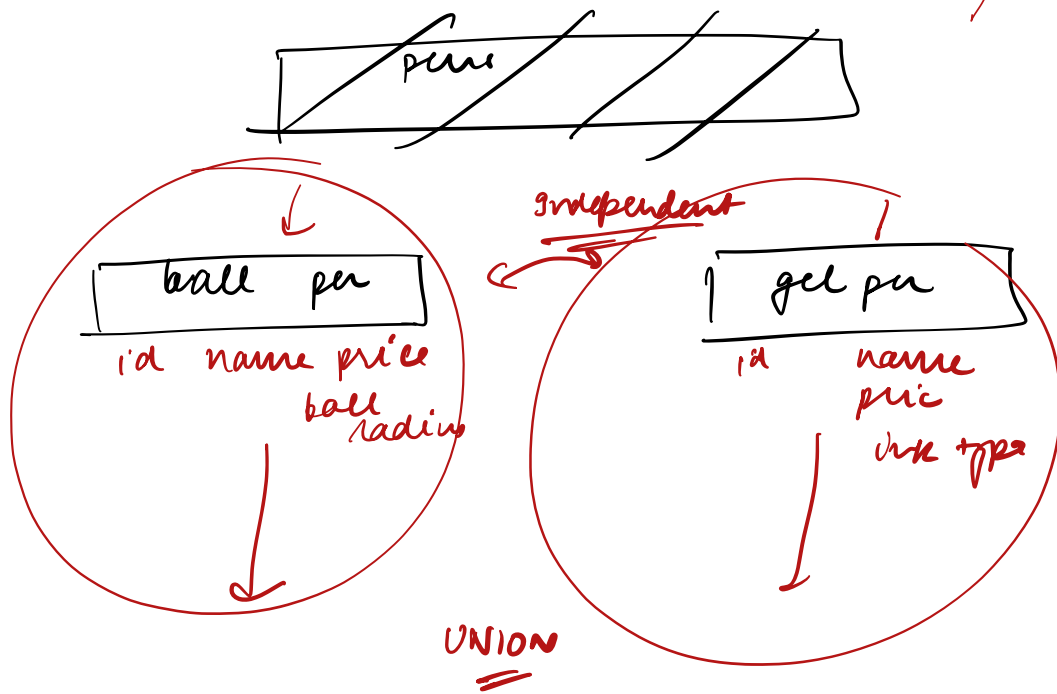

id	name
1	Occupied
2	Blocked
3	AVN

parking_spot				
id	row	col	parking_floor_id	status

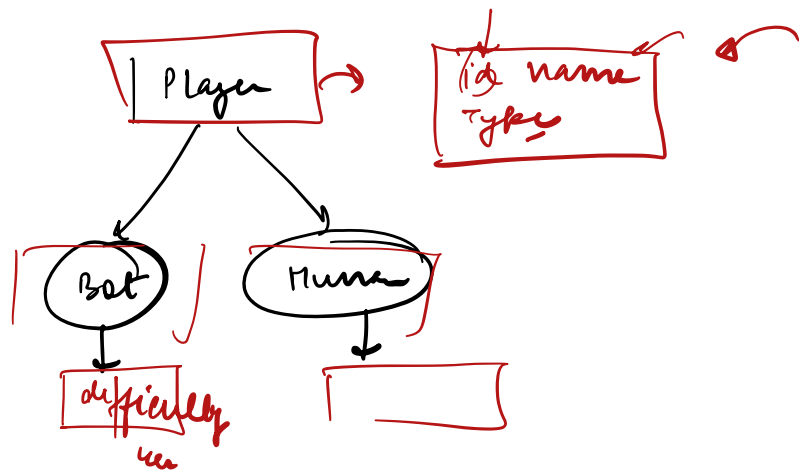

Enum
↑
id
OCCUPIED

Inheritance

- 1) Create a table for parent class
- 2) All common attributes → parent table
- 3) Remaining specific child class attributes → children table

Ticket

CRUD

Ticket Controller {

Issue Ticket Response Dto

IssueTicket (Issue Ticket Request Dto) {

}

Return type and parameters ?

DTO => Data Transfer Object

Ticket IssueTicket (vehicle no, type, Province)

IssueTicket (dto)

Class dto {
vehicle
type
}

parking controller . IssueTicket ("6536", "CAR")

parking controller . IssueTicket (Dto builder)

dto. get vehicle type

set. _____
